SURGICAL INSTRUMENT TO PERFORM SUBCUTANEOUS ENDOSCOPIC SURGERY

This invent is a surgical instrument to perform endoscopic surgery in the subcutaneous tissue. It has a workhead that can perform the funções of visualization, irrigation, aspiracion, cutting, cauterization, instrumentation in the subcutaneous tissue, and can criate its own work space without use of insuflate gas.

The Endoscopic Surgery Technics has been used in General Surgery, Ginecology, Ortopedics, and its advantages over the tradicional surgical technics has been shwoed in these diferents fields.

Endoscopic Surgery Technique allow a more comfortable position to the surgeon; the amplification of images seen in the video monitor make it more safe; delicate procedures can be performed trough small incisions, all specific advantages so diserable in Cosmetic Plastic Surgery.

Videoendoscopic technique has been developed in inner cavities and anatomical spaces that cam bee expanded by gases (peritoneal and pleural cavities) because a work space is required between the optical sisten and the tissues for the purposes of ilumunation, capture of images and execution of procedures.

Working at the subcutaneous tissue the surgeon necessary must cut a many vessels In this way the traditional

- 2 -

Endoscopic Gas Infusator Methods are a dangerous step due to the a risk of gas embolization, its dispersion and toxicity.

05 This device is a medical surgical instrument to be used in Endoscopic Plastic Surgery, the "so called " SUBCUTANEOUS TOMOSCOPE that allow to work at the subcutaneous tissue through small incision without use of gases because it can create its own work space avoiding the risk of gas embolous.

10 The characteristic of this instrument are a "workhead" like a nave or capsul that can perform a blunt/sharp dissection at the subcutaneous tissue under monitor view, and can perform Subcutaneous Endoscopic Surgery through accessory canals providing instrumentation source, light
15 source, cut/cauterization, aspiration sources. It have separators/elevators and can create its own workspace, avoiding the use of insufflate gas technics and its risks.

Diferents prototypes were built and experimental surgery has been done on dogs, pigs, and cadaveres, and the
20 viability of the method has been proved; we can perform axillary nodes and brachial plexus endoscopic exploration, the mapping out of a cutaneous flap through endoscopic plus transillumination view, flaps pedicles dissections, etc.

We have used this instrument to perform Aesthetic Plastic
25 Surgery through small incisions and I have developed and described endoscopic technics to Abdominoplasty and Mammoplasty

- 3 -

The "so called" Subcutaneoustomoscope have the following advantages:

- a) Avoid the risk of gas embolization and toxicity of the Videolaparoscopic technique;
- 05 b) Provide dissection and visualization simultaneously
- c) bring to the Plastic Surgery the advantages of a minimal invasive surgery such as: less tissue trauma , decreased rates of infection, less hospitalization time, and a small scars so deserable whem dealing with Cosmetic
10 Surgery.

In order to help the full understanding of the conception of this instrument, it will be explained and presented by same simple designs.

CLAIM

1- Medical Surgical Instrument to be used in Endoscopic Plastic Surgery without use of insufflatable gas avoiding the risk of gas embolization characterized by to be a

5- blunt/sharp dissector workhead (fig.) provided of a optical system (4), illumination source(1), irrigation source(6), aspiration source(5), a instrumentation channel to cut/cauterization/suture(3), and elevators/separators to create a subcutaneous workspace without use of gas.
